
Subject: dynamic memory in call_external

I have someone in my office who wants to know:

Is it advisable to create and destroy memory within a CALL_EXTERNAL routine? (that is, can one safely use malloc and free?) Or must one make the routine(s) in question LINKIMAGE routines and the idl memory management routines (IDL_MEMAlloc, IDL_MEMfree and IDL_GetScratch) available in that environment.

Secondly, can one create an array in IDL (in the interpreter) that is page aligned (i.e. as if one had done it using the 'valloc' version of malloc in C) which can then be passed down into the CALL_EXTERNAL routine.

This comes from someone who is trying to write wrappers for a set of device drivers for a data capture board.
