Subject: Neophyte CFD Data Plot Question
Posted by Mark Woodmansee on Mon, 01 Feb 1999 08:00:00 GMT

I have some CFD data that I would like to put into a document. The CFD
program used an unstructured grid, where a large number of grid points
were concentrated in a single area. Working on a PC with Win95, I have
tried to use Research Systems Inc. TRANSFORM to plot the
column-formatted data with little success.

Realizing that I am way behind the CFD learning curve, I would
appreciate any help or advice on how to plot this data with my PC. Is
it possible to use TRANSFORM to plot this data? If not, is there a
relatively inexpensive piece of software or shareware that I could
purchase or download to make these plots? Please note that I would need
to make only one plot, so a low-cost solution is preferred.

Thanks in advance for your help.
