Does anyone have any experience with color tables for use with Chromatek glasses? The glasses make an image appear 3-D by making the blue appear further away and the red closer. The trouble is that the standard IDL color tables don't appear to scale linearly with apparent depth. When I use Rainbow for example, the depth appears very quantized and not a nice continuum. I tried building a color table of my own for this with limited success.

Any advice or comments would be appreciated. If you haven't played around with this I recommend that you check out Chromatek's WWW site at <http://www.chromatek.com>
