Subject: Problems to use variables in a keyword-expression
Posted by Ospite1 on Tue, 09 Feb 1999 08:00:00 GMT

Hello,

at the moment I have problems to find the right syntax for using
variables in a
keyword expression.

My problem looks like this:

the user should give an identifation number (num) for example
141098222.2 . With
the FINDFILE command, which has integrated the count-keyword, I want to
find the amount of all files in my directory ' paz' which begin with
this number , they are named 141098222.21 , 141098222.22 etc.

The expression has to be something like this :

anzfile = FINDFILE [string(num*),format='(i12)' , count=anz]

Unfortunalely this is command doesn't work.

Please help me !

Ruth
