Subject: unformatted reads in fortran?

Posted by Richard G. French on Wed, 24 Feb 1999 08:00:00 GMT

Can someone save my sanity and tell me the correct syntax for
opening and reading a file in fortran, when the file was
written in IDL with the /F77_UNFORMATTED keyword set and writeU
was used? I keep getting
forrtl: severe (37): inconsistent record length
errors. Thanks! No FORTRAN manual on line, unfortunately.
