Hi folks-

I have a program here that was written for me when I was using ENVI 2.6 (I am not sure what the IDL version was) that writes all of the spectra in a hyperspectral roi to a file. (The default ENVI method is to write the ensemble spectral average to a file). However, now I am running ENVI ver 3.1 and the code doesn't work. This is a capability that I find very useful and was wondering if anybody out there would care to take "my" existing code (its short) and make it so that it will run w/ the new version of ENVI/IDL. (I tried a few things, but since my IDL programming skills are limited I can't seem to isolate the problem).

Any help would be greatly appreciated.

Thanks
