
Subject: IDL color tables under Windows NT

Hi,

I'm having a problem with color tables in IDL under Windows NT. Windows is set to display 2^{24} colors (16 million). The display settings seem to be similar to IDL on our Silicon Graphics workstations (!D.N_COLORS=2²⁴, !D.TABLE_SIZE=256). When I change the color table (for example using XLOADCT), the new color table is loaded properly (verified using TVLCT,r,g,b,/GET) but images are still displayed in greyscale. What should I change to overcome this problem? I've tried this on two machines running WinNT and one running Win98 with the same result. The IDL version is 5.2.

Thanks a lot!

Jacco
