Hi!

IDL version 5.1.1, Windows

in the online documentation of keyword\_set() isn't refered  
what is the behavior with Null object and Null Pointer.

I've tried and it returns 0, which is good for me, because  
that is the behavior that fits my needs. Because I'm developing  
an complex program and that behavior isn't documented, I'm  
afraid that it could change. Is that possible? Someone from RDI  
told you something?

Thanks for reading, Luis
