Hi there,

while reading series of files from a scratched CD (IDL, win95), readf fails when it encounters a corrupted file and my program croaks. What needs to be done to return gracefully with an error message or something?? (opening the file works fine, but some data in the middle is srcewed up...)

thanks, joern

ps: dankeschon for the answers on my previous question (terminal beep), IDL>print, string(7b) doesn't work, but the undocumented IDL>beep works on win95.
