I thought that all the compatibility problem has been solved by users.
In my case, one problem was solved following Jeremy's patch. But when I
launched my application, I got:

```
/usr/local/rsi/idl_5.2/bin/bin.linux/idl: error in loading shared libraries  
/usr/X11R6/lib/libX11.so.6: undefined symbol: __bzero
```

So, have you guys solved all the compatibility problem as much as you
want?

Please help.

Thank you

G. Hugh Song
