Subject: GNU Emacs mode for IDL
Posted by Carsten Dominik on Wed, 26 May 1999 07:00:00 GMT

Hi,

I have just uploaded version 3.3 of IDLWAVE, the GNU Emacs editing mode
for IDL and WAVE CL files.

Something very close to this version will be distributed as part of
Emacs 20.4 (maybe only in 20.5, depending on how many bugs I still
have to fix). So please test this and report back.

   http://www.strw.leidenuniv.nl/~dominik/Tools/idlwave/

Here are the changes:

Version 3.3
===========

- `C-c ?' displays the calling sequence and keyword parameters
  of a routine. Works for most builtin IDL routines, the
  routines you are currently editing, and the compiled
  routines in the idlwave-shell.

- `M-tab' completes procedure names, function names and keyword
  parameters in the buffer.

- New source file idlwave-rinfo.el contains the code for these new functions.

- Fixed bug in Makefile with obsolete `install-tags'

Version 3.2
===========

- Fixed bug with display-buffer in idlwave-shell.el for Emacs 19/20.2

- Code for the debugging toolbar moved to a new source file,
  idlwave-toolbar.el

- Cleanup after exit of the idlwave-shell is now reliable.

Good luck with it.

- Carsten
