Subject: Problem with IDL OCX

I am running an IDL program from VB using the IDL OCX file, and it
generates an EOF error message (caused by the readf function) when it
has completed the procedure for no apparent reason (There is no way that
the pointer has reached the end of the file). In fact, when I run the
procedure with all the command line parameters from the IDL command
line, I get no error messages at all. The problem must therefore lie
with the OCX. Does anyone know a work-around for this problem?

Cheers
Jacques
