Hi all,

I write a little application which needs a color table in which two (or more) IDL's color tables are as the following description:

Saying my color table has 256 color

`myCT[0 : n-1] = CompressCT(IDLCT1, n)` ; linear

compression of IDL's N-element color table into n-element color table (n <= 255)

`myCT[n : 255] = CompressCT(IDLCT2, 256-n)` ; linear compression of IDL's N-element color table into (256-n)-element color table

Does anyone implement this procedure or know where I can get it. If you have sth like XLoadCT of IDL, this' excellent !

Thanks for help.

Tri.
