Hi,
Who can explain me the strange behaviour when I passed my parameters ?
I create a small and stupid example to see the disfunctionning of IDL.
Why the first call of the procedure 'one' returns 1 and the second call
return 2 ? According the documentation of IDL, the second calling is
correct but
not the first calling.
Thank you

```
pro one, b
  b[0] = 2
end
```

```
pro two
  a = intarr(1)
  a[*] = 1
  one, a[*]
  print, a
  one, a
  print, a
end
```

```
% Compiled module: ONE.
% Compiled module: TWO.
IDL> two
  1
  2
```
