Subject: 24-bit color

Hi folks,
  We just upgraded our Alpha with a 24-bit TurboChannel module. The problem
is that in IDL color will only be displayed on tv (or any plot) if that
window is highlighted, otherwise it is displayed in black and white. This
doesn't occur when using IDL on our 8-bit X-terminals. Is there some
keyword I'm missing? I tried a couple of things in the reference manual to
no avail.

Any suggestions would be much appreciated.
--Keith A. Scollick

PS - we are running IDL 3.5.1 on an Alpha running OSF/1 v1.3a
