Dear all

David and Richard wrote about cross-platform development of GUIs
and the problems with this

[... discussion simply cut ...]

I simply gave up (was trying on Solaris and Windows95/98) - I
got them by default pretty similar but never equal...

I was doing some cross-platform development for Tcl/Tk too and
had similar problems. There I developed simply a routine which
reads a resource file where you can specify font sizes etc.
I think this way might be a good way here too...? Even different
users on the same platform have different preferences for
colors and font sizes
