
Subject: handy script

I didn't want casual users to have to define any environment variables when using pv-wave, so I wrote the following four-line script.
It can be installed as /usr/bin/wave.
(wvsetup defines wave as an alias, so the script doesn't call itself.)
- Dan Kegel

```
#!/bin/csh -f
# Set up environment variables, then invoke pv-wave
source ~pvi/wave/bin/wvsetup
wave
```
