Hi,

Just an update ...

I tried both (1) and (2) of Martin's suggestions, and got the same "undefined procedure" error message. I also get the same error if, instead of calling `comment_ev`, I try to call another event-handling procedure that works fine in other contexts.

I also tried R. Bauer's suggestion of making sure that the event= keyword in `cw_form` is given a string - in that case, I got an error message saying that my string variable (`event_string='comment_ev'`) was an undefined procedure.

So I've given up on using `cw_form` for now. In hindsight, it wouldn't have saved me that much programming anyway.

Thanks for the tips,  
Kristine

P.S. Thanks, Martin, for your advice in (3) - I'll keep that in mind next time I have a mysterious problem!
