Subject: How to pass the slider value?

Hi,

I am writing a widget program that can display multiframe images. I
created tlb widget and several children widgets. One of them 'cine'
should display animation. I would like to have an opportunity to change
the speed of this animation. I tried to make 'slider' widget as a child
of 'cine' and to pass the value from widget_slider structure back to
'cine'. I tried to assign UValue=speed in 'cine' and pass event.value of
the sliders event_structure to the speed in slider's event handler. As
well I tried to pass speed trough tlb' info. I did not have a success in
both cases. I suppose it is a very basic task and could be resolved with
some very easy way but I cannot find it.

Can anybody explain me how to pass slider's value into the parent vidget
or send me any easy example with something similar?

I'll appreciate any help,

Leonid Syrkin.
