Just for completeness, here's how I do it on a Mac:

```
script = 'tell application "Finder"'
script = [script, ' make new folder at item "' + path + '"']
script = [script, ' select result']
script = [script, ' set name of selection to "' + newdir + '"']
script = [script, 'end tell']
do_apple_script script
```

How do the Slaves Of Gates do it?

Struan
