Noesys 2.0 is now shipping. It is the first release to integrate IDL into the easy interface of Noesys as a result of the alliance between Research Systems and Fortner Software LLC. Noesys is known for its easy access to data, especially HDF, and IDL adds more power and flexibility to extend Noesys. Available for Windows and Mac, Noesys 2.0 adds import/export translators (SDTS, GeoTIFF), several map projections, HDF-EOS support and it includes Transform, T3D and Plot. For more information, visit the Research Systems Web site at <http://www.rsinc.com/noesys> or send email to noesys@rsinc.com.
