Subject: overlapping plots

Posted by ftacn on Mon, 10 Jan 1994 15:47:03 GMT

I've got a question: I'm making some IDL plots that have
shaded regions that overlap. Right now, the region that's printed first
covers up the other region. Do you know of a way to make it so the both
shaded regions can be seen and the one in the foreground doesn't totally
block out the one behind? I guess what I want is a shading that acts
transparent so that you can still see the shaded region under it.
Did that make sense? Got any ideas?
