Hi

I got a little problem with compiling programmes in IDL5.2. Usually everything works just fine, but sometimes (about 1 in 5) some procedure or function just doesn't compile and I get an "undefined variablename"-error with the name of the procedure as undefined variablename. If I compile the programm again after the error, it usually runs fine.

All my procedures are in one file and the main procedure is the last one.

Anyone got a similar problem solved or knows anything about why this happens?

Thanks,

Joerg Mosthaf
