I have a Postscript Declaser 2250 printer connected to the printserver. It was set up on Sun with logic name 'lp0'. I can print from any Unix application using command 'lp -d lp0'. When I specify the same command under IDLDE Print Setup (port lp0=lp -d lp0 for Digital DEClaser 2250) it never prints. I have to save file as xprinter.eps and then print.

How can I set up my printer to make it print from File->Print?

Thanks in advance,

Leonid Syrkin.
