Hi,

Using window, device or widget\_control will crash idl on our aix installation using simple netCDF commands. I like to know if somebody else has the same problem or not.

Who don't have already a netCDF File should try the example routine ncdf\_rdwr from the examples/misc/sdf directory.

I have had no problems with the previous aix Version and the old IDL 5.1. The problems are also given by the actual aix Version and the old IDL 5.1.

PRO ncdf\_error2

; One following three commands will crash idl using aix IDL 5.2.1

window,0,xsize=100,ysize=100,color=256

device,decomposed=0

widget\_control,default\_font='-adobe-helvetica-medium-r-norma l--12-\*-\*-\*60-\*-\*'

; -----

FOR ii=0,200 DO BEGIN

PRINT,ii

FOR i=1,30 DO BEGIN

cdfid = NCDF\_OPEN('ncdf\_error.nc',/NOWRITE) ; OPEN the file

NCDF\_CLOSE,cdfid

ENDFOR

ENDFOR

END

Regards

R.Bauer
