Instead of using the '.run' command to compile the module, use the '.rnew' command. It will overwrite the old module with the new version. If you are having the original module fail, you may also need to execute a 'return' or 'retall' command to get you out of the original failed module to be able to re-compile it.

Just as an aside, I find that the ability to incrementally compile pieces of code in IDL a great idea, and make IDL a good environment for code development.
