I have to add, that's the routine also crashes idl if I don't use a startup file.

Instead of a startup file I include the commands into the routine.

```
PRO ncdf_error2
; One following three commands will crash idl using aix IDL 5.2.1

window,0,xsize=100,ysize=100,color=256
device,decomposed=0
widget_control,default_font='-adobe-helvetica-medium-r-normal--12-*-*-*60-*-*'

; -----

FOR ii=0,200 DO BEGIN
    PRINT,ii
    FOR i=1,30 DO BEGIN
        cdfid = NCDF_OPEN('ncdf_error.nc',/NOWRITE) ; OPEN the file
        NCDF_CLOSE,cdfid
    ENDFOR
ENDFOR
END
```

Who don't have already a netCDF File should try the example routine `ncdf_rdwr` from the `examples/misc/sdf` directory.

Regards
