Just to follow up: I did try experimenting with some of my own multispectral images in true color mode. After I displayed the images in the RGB channels, I then displayed a pure white box in one corner. I then tried various switches in COLOR_QUAN (e.g. DITHER on and off), but the 'white' color table entries always came out at 248 rather than 255. Hence the hack.

Cheers,
Liam.
