I have an animal that does the trick (call it plotw), but it is not fully tamed. It accepts overplots, it can change scales, delete plot components, do simple geometric transformations, plot in rect/polar, replot, print, send to ps, return cursor positions, accept parent widgets, etc.

In addition, this is a routine that organically grew, and is in need of a re-write. And there are definitely bugs. I started sketching a new one at home, but it is going slowly.

However I do not have a place where to post it.
Thus, to make it public, I would need the following assistance: Somewhere where to place it, and also, a beta tester. This person would have to do a couple of trial runs to make sure that I did ship all the routines that plotw needs. For example, it uses a linked list object among others.

So it would take a few tries untill the package is self-sufficient.

Any helpers?

Mirko
