I think the solution to your problem is to make sure your remote shell command does terminate, while leaving the remote job in operation. I think this should be possible if you write a script to be run by the remsh command that goes something like this:

```
----- remscript.csh
#/bin/csh
do_my_job >& /dev/null &
----- end remscript.csh
```

and then use the spawn command approx. like this (don't know the syntax of your "remsh" command, but..):

```
spawn,"remsh machine.idcomm.com remscript.csh"
```

Some variations on a theme may apply here, but the key issue is to get your remote shell command to terminate. That means making the remote shell *script* terminate.
