View Forum Message <> Reply to Message

IDLWAVE 3.5 is ready. IDLWAVE contains the GNU EMacs modes for
editing IDL .pro files and running IDL as an inferior shell. Here are
the changes in version 3.5.

 - Documentation (~20 pages) in TeXInfo format replaces the file
   commentaries. The documentation is part of the distrubution.
   Postscript and HTML versions of it are also available on the web
   page.

 - Completion and Routine Info display now also work for object
   methods. In IDL .pro buffers and under the shell.

 - IDLWAVE knows the calling sequences and keyword lists for all
   1109 builtin IDL routines, all routines in Emacs buffers and all
   modules compiled under the Shell.

 - The Debugging Toolbar which so far was only available for XEmacs
   is ported to Emacs. Emacs 21 will be needed to display it.

 - The variable `idlwave-shell-use-breakpoint-glyph' no longer
   exists - see the new variable `idlwave-shell-mark-breakpoints'.
