Subject: NT IDL Crashes
Posted by Martin Downing on Thu, 26 Aug 1999 07:00:00 GMT

Hi All,

I'm running IDL5.2 under windows NT4.0(sp4) and I am getting fed up with the number of IDL program crashes (about 3-6 a day). They happen both during program code execution and also just duing editing in the IDLDE. Doesnt kill NT, just IDL, however I never had this experience on UNIX (admittedly using IDL4).
Is this a typical experience of windows users ? or should i have my head (or at least hardware) examined!

(anyone from RSI listening?)

Martin
