
Subject: Resetting data in IDLgrVolume object

IDL gives a warning when I reset the 3D data in a IDLgrVolume object with new data

eg.

```
sState.oVolHead->SetProperty, data0 = headData , /NO_COPY
```

```
% IDLGRVOLUME::SETPROPERTY: Warning: New volume data with new dimensions forced removal of old data.
```

Is this normal/safe and could I suppress it? Is the old data memory being properly freed up ? Could I be creating a memory leak?

Also, what is up with the 2 different data terms (data0 and data1) for IDLgrVOLUME ? What would be a good example of using both together ?

Rich
