Can we bounce between
device, true_color=24 and
device, pseudo_color=8

in a single session,

Three of us used to this all the time in old versions of IDL and 'Wave and either something has changed or we've gone foggy and forgot the magic missing step. We've used it before after and inbetween "window" commands and nothing has worked.

The only way for it to work is to use one in a given session and stick with it.

It's got to be something simple... Ideas?
