Hi, I run WinNT on a PC and IDL 5.2.1. I use the statement:  
Device, Decomposed=0  
to use colortable mapping and produce some fine images in screen  
windows.

Then I read them in amd make GIF's:  
imgA = TVRD()  
Write\_Gif, 'image\_a.gif', imgA

These GIF's however, have mostly white colors. Any ideas?
