Thanks for the replies.

However, from what has been said, I don't think at the moment it is worth getting a dual processor system (why pay more and have more hassle for little performance improvement!)

I find it a bit strange though that IDL can't be implimented in this way. If IDI could be run with multithreads it would enable some of the IDL processing functions such as rendering and projections to be done on the fly (our radiologists would like that!) Is this a possible enhancement of IDL in the future, or will pigs fly first??

Cheers

Dave Brennan
