Did anybody succeeded to integrate IDL with
some your own application under Windows?
I'd like to use it as something like OpenGL
but more 'high-level' for creating good scientific
graphics on-fly. Now what me and all my colleagues
are doing is
Step1) creating data (mostly with fortran codes)
Step2) wizarding with IDL/PVWave/TecPlot/Noesys
/Origin/Surfer/Yorick/etc afterward

Yes, it is possible to make this with OpenGL
primitives but this route is like re-invent bycycle when
specialised scientific graphics packages such as IDL exist.

Rough idea what's needed is constructed here:
<http://members.gotnet.net/radinc/tmp/clearwin.gif>
(such or more complex GUI can be within minutes
to an hour built with widgets with some applications,
fortran for example)...

Later,
R
