Hi,

how do i output Mdot (M with a dot over it) using PS fonts??

I've tried something like '!SM!R!A.' (save position, M, restore position, shift above division line, "."), but that does not center the dot over M. I've tried outputting " .", but that does not exactly center the dot either. It seems that there is no way to center the dot over the letter, is there??

along a different line of reasoning, can i output postscript code directly from xyouts??

greg

PS. i'm aware of several really cludgy way of doing this, but i want something that works reliably, for different fonts, etc. anyone?
