hi,

I am running idl 3.5.1 on a sparc station with Open look and I am trying to get some information about resizing widgets. It appears they they scale in extent (or at least width wise) Is it possible to give these widgets relative positioning, and maybe even relative sizing?

Also, if anyone would like to comment about their experience of converting widgets between 3.1 and 3.5.1 I would be interested. Seems some things work a little different.

ALSO, COMPOUND WIDGET question, or maybe not compound widget question. If I build an application with widgets, and I want saw a draw widgets events to be handled separately from the rest of the application, do I have to make it a compound widget so that its events can be trapped differently and handled by a routine I set up within a compound widget? Yes I am using XMANAGER and am therefore trying not to use /EVENT_PRO keyword for widget_draw (or at least I think that's what the 10,000 warnings say)

thanks a bunch for any input on this stuff,

-stephen Strebel
