Subject: Table widgets
Posted by nilsj on Sun, 10 Oct 1999 07:00:00 GMT

I have two questions about the WIDGET_TABLE command. I am trying to
create a read-only table as part of a larger widget. It's not too
hard to get something going, but...

1. There is a funny "gap" on the right and bottom sides of the table.
What is the reason for this extra space, and is there any way to get
rid of it?

2. I would like to set the column widths so that no text is cut off.
Is there a relatively easy way to determine the number of pixels (or
inches, or centimeters) a given string will take on the screen? Or
is there some other slick way?
