Subject: plot axis colors
Posted by Dave Avis on Thu, 21 Oct 1999 07:00:00 GMT

When using colortables (the built-in ones) with a plot, sometimes the axis
color causes the axis and labels to disappear. I figure that it is because
the axis and the labels are set to a particular element of the color table
and that element is the same color as the background color of the plot
window. How would I go about changing this without editing the color table?
If I have to edit the color table, which element is the one that the axis
and labels use, or how can I find out? I have this problem on the color
table named either "prism" or "spectrum" (sorry, don't remember the number
offhand).
