Subject: Inheritance query

Hello

For the object programming gurus: I'm creating a class called data. I'm then creating subclasses of data called type1, type2, etc. The type1 class inherits the data class attributes. Now, is it possible to inherit, lets say, the data::INIT method and somehow add to it? Or, do I have to write an entirely new INIT method for type1 class which incorporates the statements in the data::INIT method?
