Subject: Event generation by object.

Posted by E Hummel on Wed, 10 Nov 1999 08:00:00 GMT

Suppose an objectData which contains some data. Another objectOther is interested in this objectData.
I like to have the following situation:
The data of objectData is modified. This objectData generates an event on this modification. The event
can be received by objectOther if this objectOther has subscribed on notifications of objectData.
Both these objects don't have widgets.
Question: is there an event mechanism in IDL which makes this possible?

Regards,
    Erik
