Hi y'all,

Does anyone know if it is possible to mix different Postscript fonts in a single string in PV-Wave 4.0? I know from Eric Deutsch's example post script programs that you can do it in IDL by including things like !9 to switch to symbol. This doesn't work in WAVE, though and the manual seems to say that the only way to switch fonts is with the device command, which I don't see as useful for mixing fonts in a single string, i.e. in XTitle for a PLOT PLOT command.

Thanks,  
Larry Nittler
