Nice article! Only one little bit of info missing: what's the file size for the various versions? I remember some examples when a preview image would blow up the eps file considerably - and one could be tempted to conceive that the wonderful TIFF image is somewhat larger than the others.

I know, I know: GB/\$ is a monotonously increasing function - yet, there are still some dinosaurs who may want to send files on floppies or who have steam-powered computers ...

Cheers, Martin
