I have used these keywords extensively on a Solaris but I hadn't noticed a problem. How can you tell that they don't work as expected? (I know that sounds like a silly question... but maybe its not working for me either and I simply didn't know better!)

I did bump into an oddity with the Solaris system I was operating... expose events were handled by the system regardless of the value set for the RETAIN keyword. I don't know if/how RSI resolved this issue... but it was placed in the bug reporting queue.
