Subject: WWTEXT scroll position. Posted by nittler on Wed, 01 Dec 1999 08:00:00 GMT View Forum Message <> Reply to Message

Hi peoples.

I thought I had posted this already but it never showed up. I am now developing widget applications in both PV-WAVE and IDL and my head is swimming. For one WAVE application, I want to use a widget text (WWTEXT) window to output information messages as the program runs, basically a console window. I have run into two problems. First there doesn't seem to be a way to directly append text to a WWTEXT widget. Well I fixed this by writing a routine to read the current contents of the widget, tack on the new contents and put the whole thing back in the widget. This is fine, but it leads to the second problem, namely that I can't figure out how to set the scroll position of the window. So, once I rewrite the text to the widget the scroll is always set to the first line, whereas I want it to be set to the most recently written (last) line. Can anybody help?

Cheers, Larry
