I know it is tempting to blame IDL for this, but
after a long, frustrating weekend getting my
Windows NT 4.0, SP4 machine back together after
installing a new device driver, I'm not so sure.

Last week I installed an updated graphics driver.
Soon after I noticed a fatal error every time I
tried to connect to the Internet. Absolutely
reproducible. I de-installed the driver and
re-installed the previous one. No help. I
re-installed the Dial-up connection service,
which is the code causing the error. No help.
I re-installed *all* my network services. No help.
I went back to the very first graphics drivers and
installed all up to the last update. No help.

Finally, it's about 2:30 AM and I say to hell with
it and I re-install the updated driver that caused
me all the problems in the first place. Bingo. Problem
solved.

AAAAAAuuuuuughhhh!

Cheers,

David

P.S. Let's just say I'm reading Linux books even as

we speak. :-(
