
Subject: Deleting structures in IDL??

Forgive me if this is in the group FAQ - it's been a while since I had one of those saved.

Anyway, I have a structure in IDL v3.1.0 that has such goodies as variable sized arrays of sub-structures. The only problem now is that I can't use RESTORE to load in the structures without getting an error message. Yet I need an efficient method of summarizing the data from these files which are so large that SAVE/RESTORE is the only good way to save them.

Any suggestions?
