Hi Folks,

Hope all of your computers survived the New Year! :-)

I kept waiting around for Struan to step into the breach here and update my CW_FIELD replacement programs so that you can specify the format of numbers in the field, but he must have other things to do. :-)

So, anyway, since I found I needed this functionality myself, I went ahead and figured something out (although I'm not sure this is what Struan had in mind when he made the request for number formats in the field). It turns out that actually formatting the numbers with a FORMAT statement (which was how I originally unsuccessfully approached the problem) is problematic, for several reasons, but probably closely related to lousy initial design choices.

But since all I really needed for my application is a way to specify the number of digits to the right of the decimal point in floating numbers and the number of total digits in an integer number, I implemented the functionality with new DECIMAL and DIGITS keywords.

The programs (which, as you recall, were designed to solve the problem of CW_FIELD input fields not looking editable on Windows machines) can be found here:

http://www.dfanning.com/programs/coyote_field.pro
http://www.dfanning.com/programs/fsc_inputfield__define.pro

The first program is a "normal" compound widget and is a drop-in replacement (with better functionality, obviously) for CW_FIELD. The second program is the same as the first, but written as an object compound widget to give people some idea of how this is done.

Compiling either program will reveal an EXAMPLE program at the bottom of the code that will exercise the program functionality a bit for you, including this new formatting functionality.

As always, I appreciate the feedback.

Cheers,

David
